Computer Aided Design Software For Designers and Engineers in India A rapid prototyping software application is one of the latest engineering tools for designers. It is typically used to produce 3D models from the digital data stored in a 3D model database, in order to rapidly create models or moulds, jigs and fixtures for products. Any CAD software can be used to generate 3D models. But rapid prototyping software applications generate models from a CAD model for direct use in manufacturing. Rapid prototyping is especially useful for product development. For example, rapid prototyping is often used for rapid creation of concept models. Rapid prototyping may be used for other applications such as rapid creation of jigs and fixtures, to speed up product design and development. A 3D model of an actual part is not required for rapid prototyping. The part can be built from 3D model data. Rapid prototyping software may also generate an STL file, a format of 3D model data files widely used for printing models. Rapid prototyping software produces 3D models from a database of digital data. The 3D model generated by rapid prototyping software can be used to create a mould or part. It also supports a wide variety of materials and processes. The rapid prototyping process is typically iterative and feedback-driven. Engineers typically adjust parameters or design details after a model is generated. Parameters are characteristics such as size, shape, colour, and material. Computer-aided design (CAD) and drafting software enable designers to create 3D models, and to create and modify 2D drawings. It is a set of software applications used for designing and drafting 2D and 3D models and drawings. CAD is one of the most widespread methods

Trying to find info on how your pipe is custom made? I have some pics of my welds on a pipe we are building for a friend. I am not sure what kind of pipe it is but he said that you weld the inside of the pipe first and then drill through it with a 1" bit. (he said there are holes from a previous drill bit that we used) He wants to use the pipe like a pressure tank with a spring (the pipe already is a pressure tank) so the gas would be pushing against the spring. There will be no seam welds on the inside. We are going to end up with maybe 8 or 10 welds on the inside of the pipe. I am sure there are different kinds of pipe but I am not sure what kind of pipe is used for springs. Any help would be appreciated. Thanks guys. Re: Trying to find info on how your pipe is custom made? I had a pressure tank installed in my truck last year by a guy that was welding in place of me. It was a welded connection of pipe, some 3/8" flange, and a 1/2" flange. We did not use an epoxy grout to seal it. He did say that if you need an epoxy grout I was to call him and he would make one. Despite the limited availability of high-performance computers and sophisticated software, much effort is currently being directed towards the development of lower cost, faster, more accurate and more versatile measurement, test and analysis techniques. Of these, sample pyrolysis is one of the oldest and best known, providing a versatile method of obtaining compositional information about materials. The general principles of pyrolysis have been extensively documented (see for example, "Pyrolysis: Science and Technology" by S. Williams, Chapman & Hall, London, New York and San Francisco, 1985; "Industrial Analysis by Pyrolysis", S. Williams, Kirk-Othmer Encyclopedia of Chemical Technology, Volume 1, John Wiley & Sons, New York, pp. 2-4, 1994). Pyrolysis, also referred to as pyrolysis or combustion, is a process in which a substance is burned to form an evolved gas, generally in the presence of oxygen. Common applications of pyrolysis include sampling and analysis of gas, liquids and solids for the purpose of determining the composition of the material sampled. For example, in industrial applications, samples of gas, liquids and solids are pyrolyzed to obtain compositional information for use in diagnosing and/or control of such processes. Traditional pyrolysis processes generally involve relatively low temperatures and prolonged exposures (in some cases for several hours or even days). Therefore, traditional pyrolysis is generally slow and costly, and cannot be carried out under certain circumstances, such as in-situ, or where samples are highly heat sensitive. Accordingly, there is a need for improved methods and apparatuses for pyrolyzing samples. There is a particular need for methods and apparatuses that are capable of significantly higher rates of temperature/time for much shorter exposure times. There is also a need for such methods and apparatuses to be effective on materials that are difficult or impossible to analyze using traditional pyrolysis methods and apparatuses.
